Exit ticket · Lesson 2 — Answers

Zoe earns $20 per hour. She worked 4 hours on Wednesday and 3 hours on Sunday at double time.

(a) Find Zoe's total pay.

$20 × 4 = $80
$20 × 2 = $40 per hour, and $40 × 3 = $120
Total: $80 + $120 = $200

(b) Zoe's friend says her Sunday rate is $20 + 2 = $22 per hour. Explain the mistake in one sentence.

Double time means the base rate is multiplied by 2, so Zoe's Sunday rate is $40 per hour, not $22.

Success criteria Tick the ones you can now do.

- ☐ I can **work backwards** from total pay to find the base hourly rate
- ☐ I can **tell apart** "time and a half" (× 1.5) and "double time" (× 2), and **explain** why the multiplier is multiplied, not added
- ☐ I can **calculate** total pay for an irregular week (weekday, Saturday, public holiday)
- ☐ I can **calculate** overtime pay when the rate changes after the first 2 hours

For any you cannot tick, write the step that is still unclear.
