Exit ticket · Lesson 3

Answers

Tax table extract and calculator allowed.

(a) Lucas earns $41,600 per year. What is his gross weekly pay?

$41,600 ÷ 52 = $800

(b) Use the tax table (tax-free threshold claimed) to find his net weekly pay.

Tax withheld ($800, column 2): $83
Net pay = $800 − $83 = $717

(c) Tim says Lucas's monthly pay is 4 × his weekly pay. Write one sentence explaining why this is wrong.

A month is about 4.33 weeks, not 4, because a year has 52 weeks but 12 months. So 4 × weekly pay is too small.

(d) Find each person's pay.

(i) Jess earns a $400 retainer plus 5% commission. This week she sold $5,000 of phones.

0.05 × $5,000 = $250
$400 + $250 = $650

(ii) Ella's base rate is $25. She works 4 hours on Sunday at double time.

$25 × 2 = $50 per hour
$50 × 4 = $200

Success criteria Tick the ones you can now do.

- ☐ I can **convert** pay between weekly, fortnightly, monthly and yearly amounts using 1 year = 52 weeks, and **explain** why monthly pay is not 4 × weekly pay
- ☐ I can **read** the ATO weekly tax table to find the tax withheld
- ☐ I can **calculate** leave loading as a percentage of normal pay for the leave period
- ☐ I can **calculate** net pay by subtracting the tax withheld from gross pay

For any you cannot tick, write the step that is still unclear.
